Debugging Hints

Drawing Counts

It is possible to get a large pixel difference if you draw the same line or box multiple times. The DrawingPanel class has an option to help you explore this. Set up your Graphics object this way:

```
Graphics g = panel.getDebuggingGraphics();
```

When you do so, you can include the following line of code at the end of main:

```
System.out.println(panel.getCounts());
```

This is the output produced for the sample solution:

```
{drawLine=532, fillRect=266}
```

You do not have to match these counts if you are within 500 pixels of difference.
